

# 2 Ways to Create Strings

## String Interpolation

```
override fun toString(): String = "($x, $y)"
```

## StringBuilder

```
override fun toString(): String {  
    val sb = StringBuilder()  
    sb.append("[")  
    if (head != null) {  
        sb.append(head)  
    }  
    var curr = head?.next  
    while (curr != null) {  
        sb.append(", ")  
        sb.append(curr)  
        curr = curr.next  
    }  
    sb.append("]")  
    return sb.toString()  
}
```
